Web Application Projects with React (CSE 3395)

B.Tech CSIT – 5th Semester

Academic Year 2026–2027

Minor Project
On
Topic: Web Scrapper MERN Application

Q's	Questions
1.	Develop a full-stack Restaurant Web Scrapper Web Application using the MERN stack. Design and develop the frontend interface of a Web Scraper Application using React.js. The application should provide an attractive, responsive, and user-friendly interface through which a user can enter a website URL and view the information that would be obtained from a web scraper. a) Create a common navigation bar containing: • Application logo/icon • Application name – Web Scraper • Home • History • About/Help (optional)

b) Design a homepage containing:

- Application heading: “Web Scraper”
- Short description of the application
- Website URL input field
- Scrape Website button
- Clear/Reset button (optional)
- Appropriate web-scraping icon or illustration

Example:

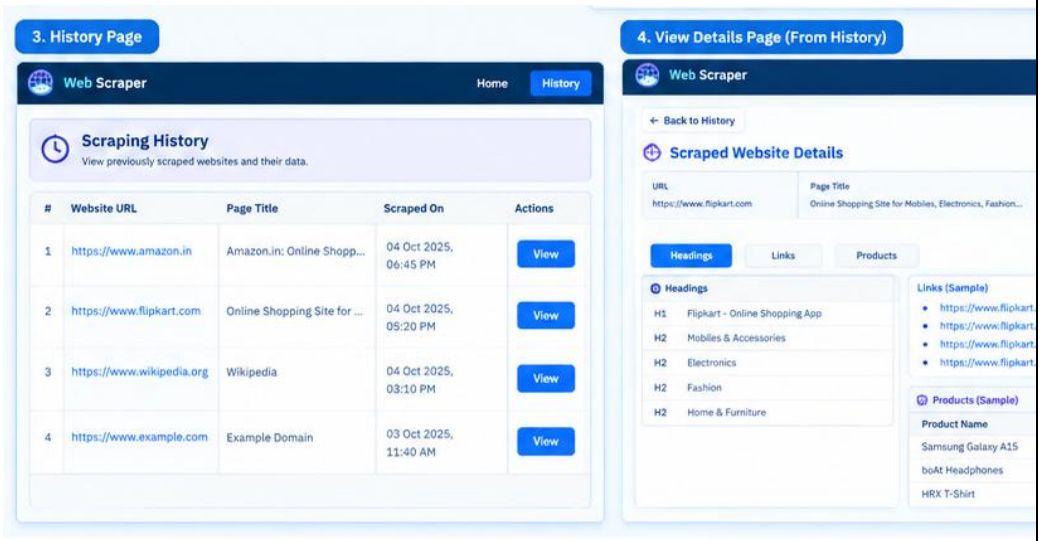

Enter Website URL https://www.example.com

[Scrape Website]

Since backend scraping is not required, the button may display sample/static data or navigate to the Results page.

c)Design a page that displays the information obtained from a scraped website. The page should contain suitable cards, tables, or sections for:

- Website URL
- Page Title
- Date and Time
- Headings
- Links

d)Create and run a MongoDB container using Docker. Perform the following operation

- Pull the MongoDB Docker image.
- Create and run a MongoDB container.
- Connect to MongoDB using mongosh.
- Create a database named: webscraper
- Create a collection named: scraped_data
- Insert sample scraped website records into the collection. Each document should contain fields such as: url, pageTitle, scrapedDate, headings,links,products
